

HUP060 run-02: unified zero-control Graph-RC SDE prediction

Rows 1 and 3 use predeclared context 3 and stochastic particle 0. Row 2 uses the exact 32-particle u=0 law reused as the Part III control baseline.

— Observed actual — Free RC-SDE, 32 particles - - - Mean absolute error
— Free RC-SDE, particle 0 — Instantaneous absolute error

The orange curve is $|\text{prediction} - \text{observation}|$ at each time point; its dashed line is MAE. The fixed particle is illustrative and was not chosen by accuracy. Distribution W_1 uses the full 32-particle law. Particles are technical stochastic realizations, not biological replicates.
